Maintenance Specialist

23+ years of experience in Oil & Gas industry

10 Years in Maintenance Planning & Scheduling

Digital Core Project Introduction

Project Overview Background on Digital Asset Management

- Our current legacy systems have outlived their fit to our business.
- Lack of complex scheduling solutions built in, has led the businesses to use a variety of tools from spreadsheets to custom apps.
- Original Processes tailored to the available functionality of the legacy system.
- **As effective as it is, it is not efficient.**

Legacy System Issues

- Costly
- Architectural Complexities
- Multiple Systems of Record
- Heavy User Workloads
- No Visibility
- Systems not tailored for complex scheduling

We Can Do Better!

Project Overview Background on Digital Asset Management

Where we are now

The enterprise technologies we use to run our business are complex and nearing end of life.

Where we are going

We want to drive technology to gain competitive advantage with one ERP.

Why

- ✓ Improve production efficiency through improved reliability of our assets.
- ✓ Enable faster, more informed decisions.
- ✓ Simplify, automate, and innovate.

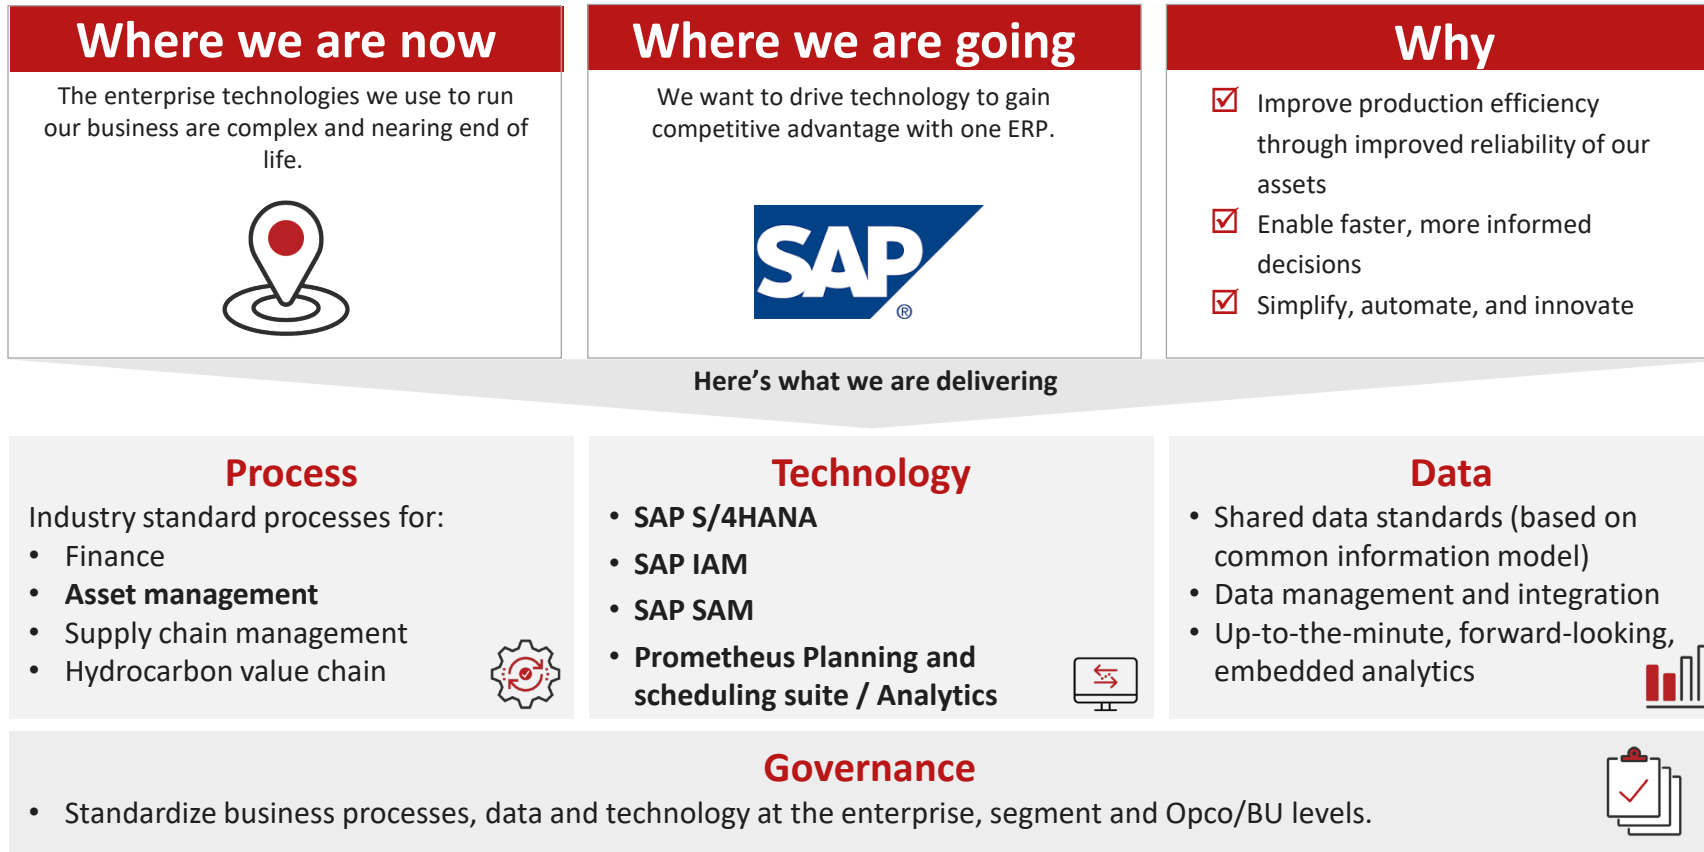

Why now

- ✓ Current systems nearing end-of-life
- ✓ Industry can integrate technology with operations
- ✓ Competition requires faster, more informed decisions
- ✓ Workforce expects simplification, automation and innovation to improve productivity

**ALL BUSINESS
UNITS TO ONE ERP**

Project Overview Background on Digital Asset Management

Project Overview Background on Digital Asset Management

Components

Deliverables

	Functional Requirement		Training
	Workflow		Metrics / Data
	Process Document		Communication Rollout

Team

Product Owner	Architects	Business Units	Subject Experts	DevOps Team	SAP	System Integrator

Standardized Process FIRM Is Chevron's Enterprise Asset Management Program

Deliver business value

Visibility between actions & value

Transparency on high-consequence equipment

Ability to prioritize critical few

Scaled to asset risk

BU Incident Prevention through Enterprise Learning

Standardized Data

Technical Object Type

It is a categorization based on the type of equipment units (e.g., pumps). The SAP field is called "Object Type". This object is often called "Equipment Class."

Class

A class groups together similar objects described by the same characteristics. The SAP field is called "Classification." This object is often called "Equipment Sub-Class."

Characteristics

A characteristic is an object that describes a property that serves to identify and differentiate among objects. E.g. operating hours, pump vibration etc. Characteristics are created centrally and used in various classes.

Catalog Profile

Catalog profile groups catalogs like Damage, Cause Codes etc. This can then be assigned to technical objects and notification types accordingly.

Equipment

Equipment are the specific maintainable items within the entire business unit such as the Motor, Pump etc.

Functional Location

Functional Location is an organizational unit that structures the assets (Equipment) of a company. It represents the place at which a maintenance task is to be performed.

Measuring Point

Measuring points describe the physical and/or logical locations at which a Condition of a Technical Object is described. E.g. Pump Inlet pressure.

Bill of Material

A bill of material is a complete, formally structured list of the components that make up a product or assembly.

Work Center

A work center is an organizational unit that identifies the person, machine or group of person/machine responsible for carrying out maintenance work.

Planner Group

A maintenance planner group is a person or group of people responsible for planning and processing maintenance tasks in a plant.

Linear Reference Pattern

Linear Reference Pattern (LRP) is a master data which is created to identify the exact location of various objects falling on linear asset.

Task List

Task List describes a sequence of individual maintenance tasks which must be repeatedly carried out.

Maintenance Plan/Item

The maintenance plans help define a list of maintenance tasks to be performed on assets. The Maintenance Item is assigned to a Maintenance Plan and it defines the scope of work like order type, assets and maintenance activity type.

Maintenance Strategy

A maintenance strategy defines the rules for the sequence of planned maintenance work.

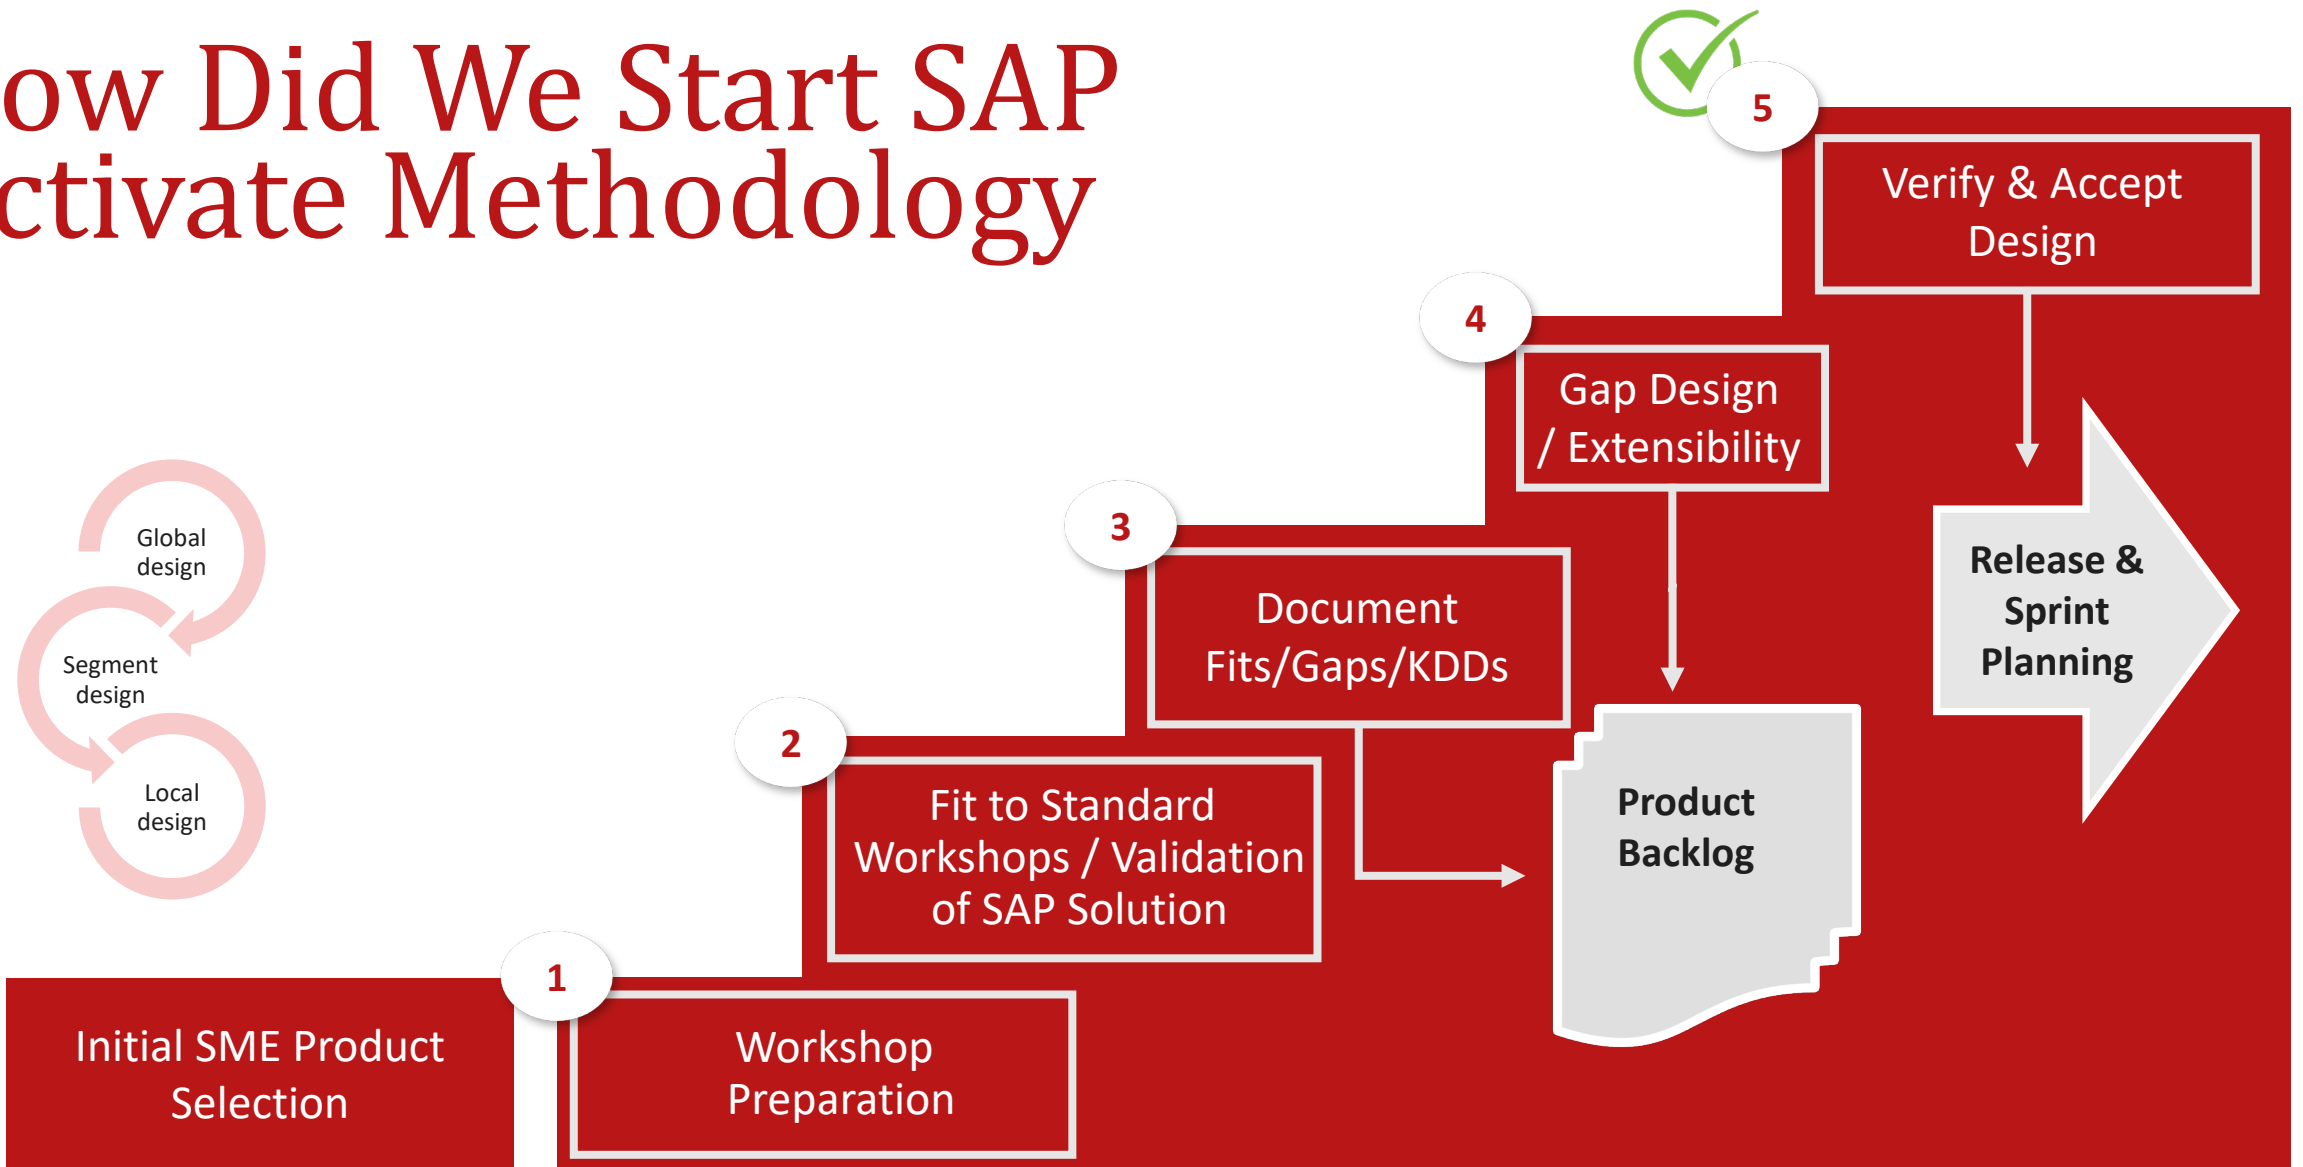

Logical Systems

A System is a logical grouping structure, grouping systems or objects with a similar functionality. A system is comprised of a set of interrelated equipment or sub-systems that regularly interact or have similar functionality.

Logical Groups

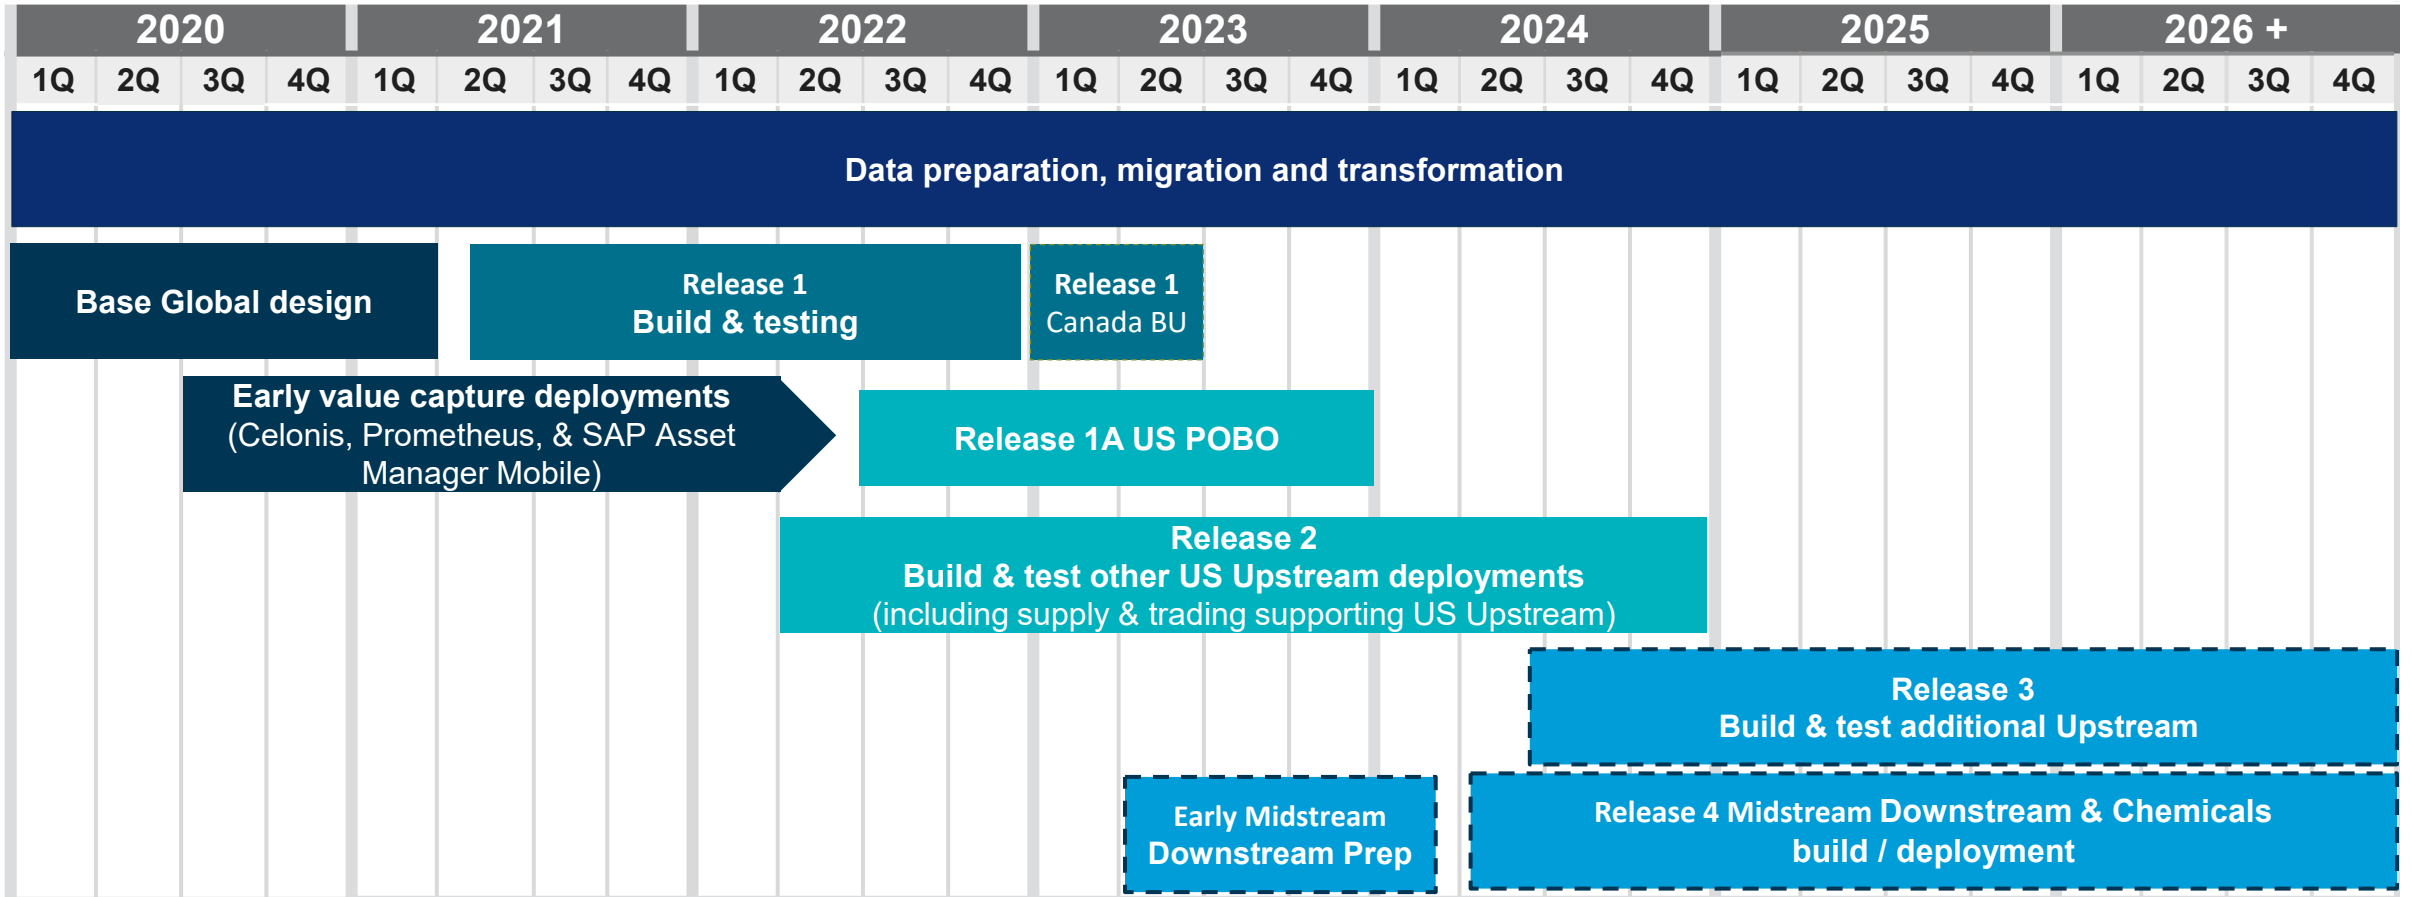

A Group can be used to logically group objects to monitor them, for analytics and structuring, or to perform mass operations on them.

How Did We Start SAP Activate Methodology

Where Are We Now?

Revised: Jan 10 2023

Timing tentative

Where Are We Now?

MVP Build

Release 1

Deliver End User Training and prep for Go-Live

R2 Focus Group Sessions

Identify New and Delta
1. Product backlog - requirements
2. Key Design Decisions

Prioritize Backlog

R2 Detail Design sessions

R1 Go Live

Set up QA system environment for testing

Realize

Phase Closure and Sign-off

Design Playback

Set up DEV system for configuration

Complete documentation

Agile Build and unit test solution

String & Integration Testing

Design end-user training and begin documentation

Operations Implementation

Cutover Preparation

Phase Closure and Sign-off

Deploy Release 2

Data Cleansed

Web Scheduler Co-Innovations

- Release 1
 - Weighted Scheduling Priority
 - Work Center Grouping
 - Phase/Subphase Support
- Roadmap
 - Mapping
 - GIS Planner Adjustments
 - Dispatch and Undispatch Reason Codes

Data Governance MDG

Centralize master data
to control access
(like create, change, approve)

Ensure data consistency via
consolidation of master data

Extend the process
by adding business logic
or reusing existing content

Integrated Object Data Model
Delivered
Out-of-the-Box

Robust Data Replication

Can be adapted and tailored based
on customer needs

Share responsibilities across various
business units

Governance, Collaboration, and Data Quality

- **Showing what was changed via complete audit trail**
 - Changes by earlier processors and own (unsaved) changes in two colors
 - Previous, changed, and last saved value per attribute
 - Available for all fields, including table cells, rows, navigation elements, ...
- **Transparency on what has happened earlier**
 - Change documents provide information on who changed which attribute from what value to what other value by when
 - Workflow logs tell who was involved in the change request process and who approved which data change
- **Helps people to do their job**
 - Supports the processor to decide on their next action
 - Supports approvers to quickly spot what they will approve
 - Supports auditors to easily see what was changed

The screenshot displays the SAP Basic Data and Change Request 8729 interface. The top section shows the 'Basic Data' tab with fields for Material (P-150118-01), Base Unit of Measure (EA), Material Type (HALB), Industry Sector (M), Material Group (02), Old Material Number (P-100), Authorization Group (EM1), Cross-Plant Material Status (02), and Batch Management (No).

The middle section, 'Display Change Documents: Change Request 8729', shows a table of attribute changes:

User Name	Date	Time	Value	Change	Attribute	Old Value	New Value
Elke Menninger	15.01.2018	15.28.21	P-150118-01	Changed	Authorization Group	EM2	EM1
				New	X-plant matl status	01	02
					Ext. Material Group		EM_M_01

The bottom section, 'Workflow Log for Change Request 8729', shows a table of workflow steps:

Work Item ID	Work Item Description	Processor	Work Item Type	Work Item Status	Decision
453617	Process Change Request 8729 (Processing of entity type Material by Elke Menninger on 15.0)	Multiple..	Dialog Step	Ready	
453616	Set Completion Time	Workflow System	Background Step	Completed	
453615	Get Process Pattern	Workflow System	Background Step	Completed	
453614	Check If Single Agent-Group Processing	Workflow System	Background Step	Completed	
453613	Set Status 02 for Change Request 8729	Workflow System	Background Step	Completed	
453612	Agent and Route Finder	Workflow System	Background Step	Completed	
453611	Get Change Request Attributes	Workflow System	Background Step	Completed	
453610	Get Change Request Type by Change Request Number	Workflow System	Background Step	Completed	

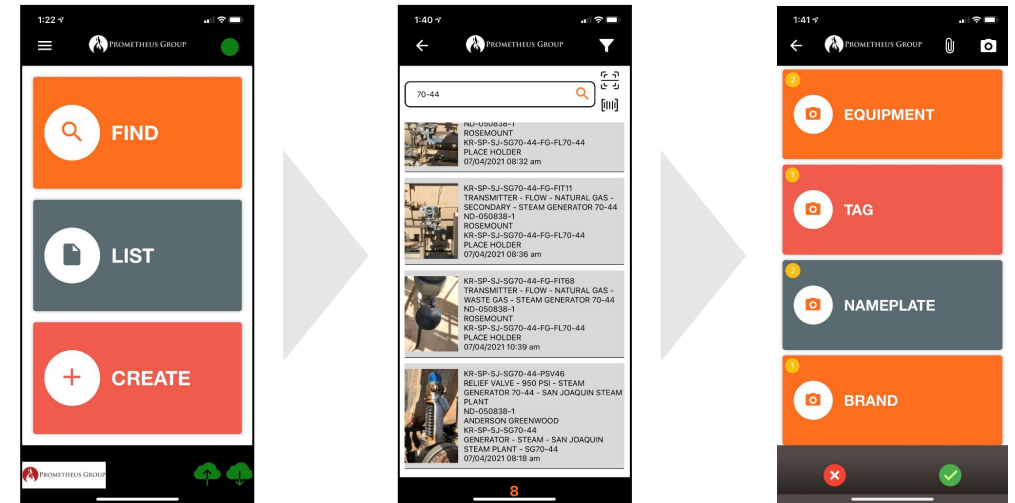

Field Data Capture at the Site Level

Pilot Goals

1. Prove the effectiveness of the Prometheus Group (PG) method for collecting, extracting, and enhancing data (a.k.a. Digital Walkdown)
2. Determine the skillsets required to effectively execute field data collection and prove 100 asset per person a day pace
3. Determine the demand on Chevron OC to effectively support PG and field data collections resources
4. Revise budget guidance and scope for field data collection efforts to support Digital Core

Concept

- **Instead of manually capturing nameplate data, we used a mobile app to capture and catalog nameplate photos**
- Vendor used their proprietary process to acquire data from photos using OCR, object detection / recognition, crowd sourcing and got two points of validation for each data point
- Vendor further enhanced data and provides a formatted load file that is used to update systems of record

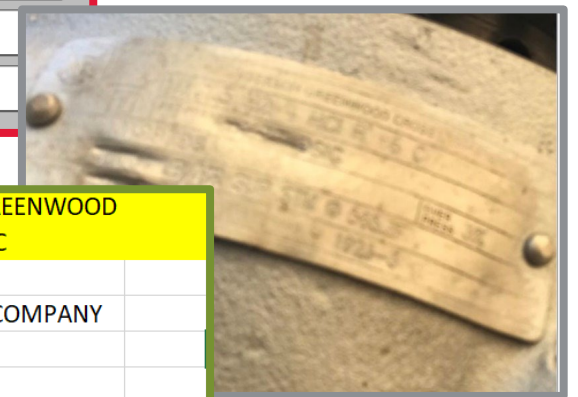

Manufacturer: FARRISINDUSTRIES

Model: 26FA10-120

Serial Number: 816298-2-A10/G

Make	ANDERSON GREENWOOD	
Model	H2 4 HCI R 86 C

No Need To Wait for the Value of Prometheus

Integration to Legacy Systems

What problems are we solving

Technical Complexities

Lifetime of Legacy System

Number of Sites Modernized

How Long to MVP Deployment

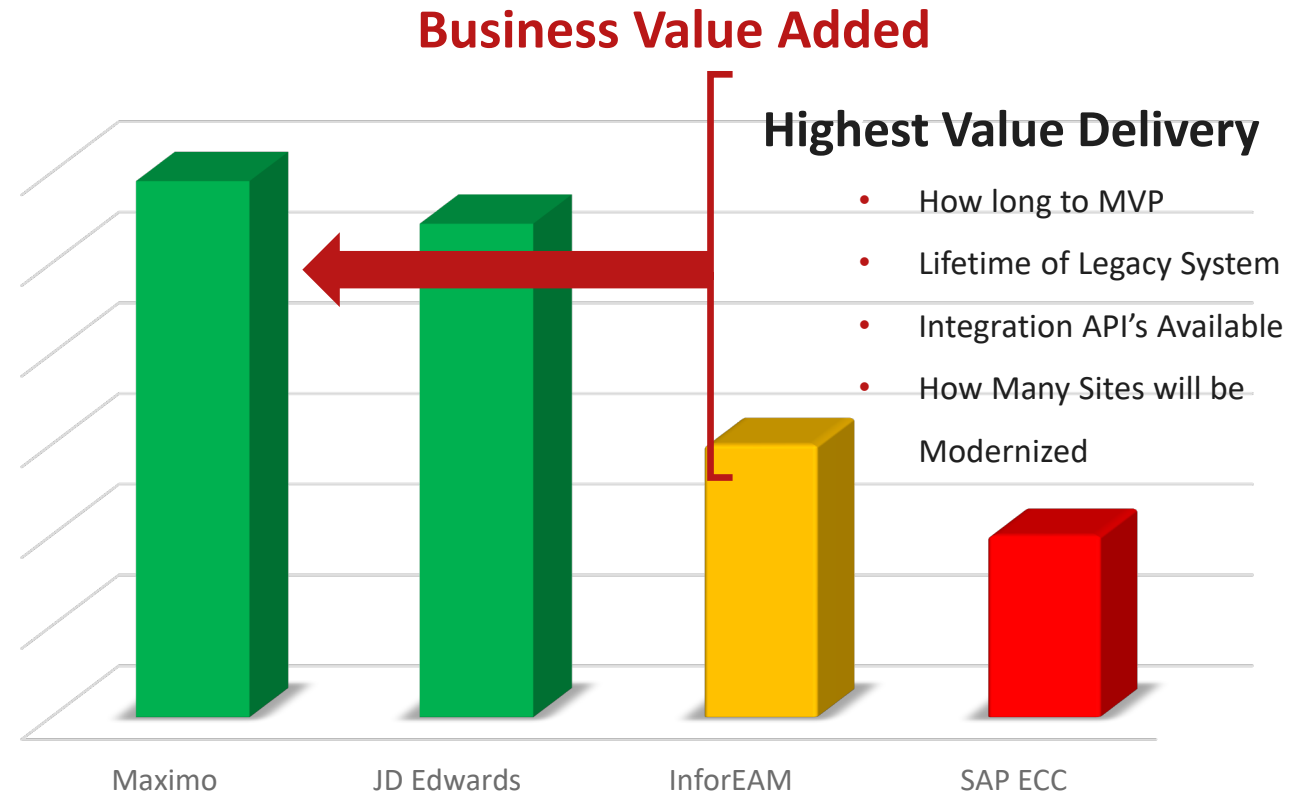

Volume of Work Orders

Available API's

Current Scheduling solution

No Need To Wait for the Value of Prometheus Final Prioritization

- After delivering the focus to Prometheus.
 - They began the process of configuring the MVP Pilot:
 - What Problems are We Solving
 - Lifetime of Legacy System
 - How long to MVP Deployment
 - Available API's
 - Technical Complexities
 - Volume of Work Order
 - Current Scheduling Solution

Legacy Systems - Where Are They Now

Fully Deployed to MFG System

4 out of 5 Refineries in use,
1 left to transition over

Positive feedback from
MFG led JDE Users to
request early deployment

Currently in Build Process
2023 target Deployment

Lessons Learned Legacy Systems

- **Early Partnership Technical Issues**

- Prometheus partnership in early design was critical to identifying Upgraded designs different from out-of-the-box released versions of ERP Systems.
- Connection to Legacy Systems were delayed due to heavy customizations that couldn't be undone. 6-8 weeks to 6-8 months
- Custom Object Structures and Logic are still proving to be a hinderance with Prometheus Out-of-the-Box Functionality.
- Prometheus uncovered tons of bad Data that needed attention (user input errors) that the Business is still working to clean up.
- Working around the customizations is limiting the tool to its scheduling basics. Still a great value to business, but not to its full potential. Early deployment proved the need for standardization.

PROMETHEUS GROUP

Lessons Learned Legacy Systems

- **BCM Feedback right After Deployment**

- Sometimes, the system doesn't work how I expect – it glitches and I must go back and try the same thing over again.
- Slight user errors have caused big issues in the EAM system.
- We are struggling with trusting the data – there is a data cleanup issue.
- Not being able to find things myself easily are what's making me want to go back and use my old tool, because I know how it works.
- We don't have time to try trouble shooting with a new tool while we're trying to get our work done.
- Because Excel added so much freedom of "custom" for us, custom functions were requested. But we had to stay within the future boundaries.

PROMETHEUS GROUP

Lessons Learned Legacy Systems

- **User Feedback After 1 Year**

- Has greatly improved our scheduling ability to provide a more consistent product to Operations.
- It has greatly improved our overall productivity by providing Operations a clear path forward of how Maintenance will be working and has greatly reduced delays due to equipment not being ready/ available.
- Prometheus, is many times better and more efficient for scheduling than our old process.
- Prometheus has saved time with building schedules and preparing schedules to be sent out.
- We currently have much shorter Optimization meetings – the OMCs and Scheduler spend many hours behind the scenes doing most of this work before the meeting.
- Developing schedules and scheduling are much easier.

PROMETHEUS GROUP

Lessons Learned Digital Transformation

- **Prometheus**

- Prometheus Web Scheduler is a flexible tool that fits an Enterprise Model of Businesses well.
- Prometheus is a superstar in partnership for Chevron Digital Core, always willing to co-innovate and look for ways to add value in a competitive digital environment.
- Business Units are Excited to see the Prometheus User Interfaces sleek and simple menus.
- Prometheus being a preferred partner with SAP has proven to be value added as the S4hana product evolves the connected tools provided by Prometheus are also adapted in a timely manner.
